Versioning

- Current integration version: 1.0.0
- Supported on ThreatQ versions >= 4.34.0

Introduction

The FireEye Intelligence Reports integration allows a FireEye user to ingest threat intelligence reports from FireEye's API using the following endpoints:

- <https://api.isightpartners.com/help/settings>
- <https://api.isightpartners.com/report/index>
- <https://api.isightpartners.com/report/{reportID}>

Notes:

- Time constrained data fetching is possible.
- The time range specified should not exceed 90 days.
- API uses HTTP with HMAC.

Installation

Perform the following steps to install the feed:

The same steps can be used to upgrade the feed to a new version.

1. Log into <https://marketplace.threatq.com/>.
2. Locate and download the **FireEye Intelligence** feed file.
3. Navigate to your ThreatQ instance.
4. Click on the **Settings** icon and select **Incoming feeds**.
5. Click on the **Add New Feed** button.
6. Upload the feed file using one of the following methods:
 - Drag and drop the file into the dialog box
 - Select **Click to Browse** to locate the feed file on your local machine

ThreatQ will inform you if the feed already exists on the platform and will require user confirmation before proceeding. ThreatQ will also inform you if the new version of the feed contains changes to the user configuration. The new user configurations will overwrite the existing ones for the feed and will require user confirmation before proceeding.

The feed will be added to the **Commercial** tab for Incoming Feeds. You will still need to [configure and then enable the feed](#).

Configuration

ThreatQuotient does not issue API keys for third-party vendors. Contact the specific vendor to obtain API keys and other feed-related credentials.

To configure the feed:

1. Click on the **Settings** icon and select **Incoming Feeds**.
2. Locate the feed under the **Commercial** tab.
3. Click on the **Feed Settings** link for the feed.
4. Under the **Connection** tab, enter the following configuration parameters:

Parameter	Description
FireEye API Public Key	The FireEye account API Key.
FireEye API Private Key	The FireEye account Secret Key.

5. Click on **Save Changes**.
6. Click on the toggle switch to the left of the feed name to enable the feed.

ThreatQ Mapping

FireEye Intelligence Reports (Feed)

`https://api.isightpartners.com/help/settings`

For manual runs, the request will contain `startDate` and `endDate` parameters to determine which reports to return for the specified time range. If the time range exceeds 90 days, the `endDate` parameter will automatically be set to 90 days from the `startDate`. Scheduled runs will pull the latest intelligence reports from the past 24 hours.

For every run, this feed makes a call to the [API User Settings endpoint](#) to determine the user's `totalRemainingQueries`. If `totalRemainingQueries` is below 2,000 queries, the feed run will complete without making any additional API calls or ingesting any threat intelligence data to avoid having the user's account blacklisted. If the user's `totalRemainingQueries` is above the threshold, the feed will make a call to the [API Report Index endpoint](#) to retrieve a list of all of the report IDs for the specified time range. A subsequent API call is made to the [Report Download endpoint](#) to retrieve an intelligence report for each report ID in the list.

FireEye Reports Index (Supplemental)

ThreatQ provides the following default mapping for this feed:

Feed Data Path	ThreatQ Entity	ThreatQ Object Type or Attribute Key	Published Date	Examples	Notes
message.report.title	report.value	N/A	mes-sage.re-port.publishDate	Apache Thrift 0.12.0 Infinite Loop Vulnerability	N/A
message.report.overview	report.-description / indicator.-description / adversary.-description / malware.-description	N/A	N/A	An authentication issues vulnerability exists within IBM WebSphere eXtreme Scale 8.6 and earlier that, when exploited, allows an attacker to remotely conduct brute force attacks and bypass password security restrictions. Exploit code is not publicly available. Mitigation options include a vendor fix. Exploitation Rating: No Known. iSIGHT Partners considers this a Low-risk vulnerability due to the limited impact of exploitation. Customers with specific questions regarding this vulnerability can contact the Vulnerability & Exploitation Team at analystaccess@isightpartners.com.	If present, mes-sage.re-port.threatDetail is appended to mes-sage.re-port.overview and included in the Description.

message.report.threatDescription	report.at-tribute / mal-ware.at-tribute	Threat Descrip-tion	mes-sage.re-port.publishDate	ZXSHELL is a backdoor that can be downloaded from the internet, particularly Chinese hacker websites. The backdoor has features including launching port scans, running a keylogger, capturing screen shots, setting up	N/A

Feed Data Path	ThreatQ Entity	ThreatQ Object Type or Attrib-ute Key	Published Date	Examples	Notes
				<p>an HTTP or SOCKS proxy, launching a reverse command shell, causing SYN floods, and transferring/deleting/running files. The publicly available version of the tool provides a graphical user interface that attackers can use to interact with victim backdoors. The language used for the bundled ZXSHELL documentation is Simplified Chinese.</p>	
message.report.abstract	report.at-tribute / indic-ator.attribute / adversary.at-tribute / mal-ware.at-tribute	Abstract	mes-sage.re-report.publishDate	<p>Salinity is a venerable family of malicious software that allows for persistent remote control over a Windows machine. The malware has features to persist on victim systems, evade anti-virus software and spread to additional machines. The malware's primary function is to act as a flexible and resilient platform for other actors in the underground economy to install malware on Salinity-infected machines, including credential theft malware, fake anti-virus, spam tools and ransomware.</p>	N/A
message.report.analysis	report.at-tribute / indic-ator.attribute / adversary.at-tribute / mal-	Analysis	mes-sage.re-report.publishDate	<p>Many similarities between TrickBot and the now-defunct https://mysight.isightpartners.com/report/full/15-00000436 banking Trojan exist, including web-inject types, code structure, and check-in types for command and control communications. Like Dyre, TrickBot also uses compromised infrastructure for some of the com-</p>	N/A

Feed Data Path	ThreatQ Entity	ThreatQ Object Type or Attrib-ute Key	Published Date	Examples	Notes
	ware.attribute			<p>munications. Although we believe that the two projects (Dyre and TrickBot) are related, the code for TrickBot has been completely rewritten so we do not believe this is a new variant, but instead its own code family. The TrickBot indicators in the report include controller URLs and nodes. These nodes or controllers are used for command and control communications, downloads, and configuration downloads (including injects). IOCs marked as "Attacker" are purely malicious. Any IOC marked as "Compromised" has been malicious at one point but may have been remediated. IP addresses marked as "Related" often include controller nodes hosted on legitimate infrastructure, possibly containing hundreds or thousands of additional hosts.</p>	
message.report.threatDetail	report.at-tribute / indic-ator.attribute / adversary.at-tribute / mal-ware.at-tribute	Threat Detail	mes-sage.re-port.publishDate	<p>On March 7, 2020, on the popular Russian-language forum exploit.in, "Buffer" advertised access allegedly to a major U.S. domain registrar. According to the actor, the company operates registries for the top-level domains (TLDs) lol, mom, sexy, link, click, help, photo, and more. The actor also claims to have found domain names containing the words "casino" and "crypto." The starting bid is listed at \$50,000 USD, with \$1,000 USD</p>	N/A

Feed Data Path	ThreatQ Entity	ThreatQ Object Type or Attrib-ute Key	Published Date	Examples	Notes
				<p>increments, and \$100,000 USD to purchase immediately. Buffer joined the forum on July 2, 2018, has 96 posts, and 46 points of reputation. The actor was recently observed advertising data from a UK operator (20-00003545). Reliability: C Credibility: 3 Threat Activity Alerts relay immediate observations of notable activities within the cyber threat environment. Accompanying reliability (A-F) and credibility (1-6) scores are based on the NATO System and reflect source confidence. The scoring is based on various factors, such as historical activities, the strength of technical findings, and reputation of the forum or actor. Unless otherwise specified, we have not verified claims by malicious actors or conducted in-depth analysis of malware or malicious infrastructure. Any indicators of compromise (IOCs) provided may contain only minimal context. Activities continue to be monitored and may result in additional alerts or reports if anything significant occurs, or the issue warrants further analysis. Please rate this product by taking a short four question survey</p>

See the FireEye API and SDK documentation for a [full list of valid values of attributes](#) such as targeted geographies and affected industries.

Known Issues/Limitations

- It is possible for a user to specify time range that does not include any intelligence reports. This will result in the feed run completing but no threat intelligence being ingested.
