Support

This integration is designated as **Not Actively Supported**.

Integrations, apps, and add-ons designated as **Not Actively Supported** are not supported by ThreatQuotient's Customer Support team.

While you can report issues to ThreatQ's Customer Support team regarding the integration/app/add-on, you are solely responsible for ensuring proper functionality and version compatibility of Not Supported designations with the applicable ThreatQuotient software.

If unresolvable functional or compatibility issues are encountered, you may be required to uninstall the integration/app/add-on from your ThreatQuotient environment in order for ThreatQuotient to fulfill support obligations.

For ThreatQuotient Hosted instance customers, the Service Level Commitment and Service Level Credit in the ThreatQuotient Service Level Schedule will not apply to issues caused by Not Actively Supported integrations/apps/add-ons.

Integration Details

ThreatQuotient provides the following details for this integration:

Current Integration Version	1.0.0
Compatible with ThreatQ Versions	>= 4.35.0
Support Tier	Not Actively Supported
ThreatQ Marketplace	https://marketplace.threatq.com/details/flashpoint-compromised-accounts-cdf

Introduction

The Flashpoint Compromised Accounts feed for ThreatQ enables the automatic ingestion of an organization's compromised credentials into ThreatQ. Ultimately, tracking the accounts to link them to internal incidents as well as mitigating potential future breaches.

The integration provides the following feed:

- **Flashpoint Compromised Accounts** - ingests Compromised Accounts as the main object and Alerts as related objects.

The integration ingests the following system objects:

- Alert
- Compromised Account

Prerequisites

Review the requirements below before attempting to install the CDF.

Compromised Account Custom Object

The integration requires the Compromised Account custom object.

For export purposes, the system name for Compromised Account objects is `account`.

Use the steps provided to install the Compromised Account custom object.

When installing the custom objects, be aware that any in-progress feed runs will be cancelled, and the API will be in maintenance mode.

1. Download the custom object zip file from the ThreatQ Marketplace and unzip its contents.
2. SSH into your ThreatQ instance.
3. Navigate to tmp directory:

```
<> cd /tmp/
```

4. Create a new directory:

```
<> mkdir flashpoint_cdf
```

5. Upload the **account.json** and **install.sh** script into this new directory.
6. Create a new directory called **images** within the `flashpoint_cdf` directory.

```
<> mkdir images
```

7. Upload the `account.svg`.
8. Navigate to the `/tmp/flashpoint_cdf`.

The directory should resemble the following:

- tmp
 - flashpoint_cdf

- account.json
- install.sh
- images
 - account.svg

9. Run the following command to ensure that you have the proper permissions to install the custom object:

```
<> chmod +x install.sh
```

10. Run the following command:

```
<> sudo ./install.sh
```

You must be in the directory level that houses the install.sh and json files when running this command.

The installation script will automatically put the application into maintenance mode, move the files to their required directories, install the custom object, update permissions, bring the application out of maintenance mode, and restart dynamo.

11. Remove the temporary directory, after the custom object has been installed, as the files are no longer needed:

```
<> rm -rf flashpoint_cdf
```

Installation

 The CDF requires the installation of a custom object before installing the actual CDF. See the [Prerequisites](#) chapter for more details. The custom object must be installed prior to installing the CDF. Attempting to install the CDF without the custom object will cause the CDF install process to fail.

Perform the following steps to install the integration:

 The same steps can be used to upgrade the integration to a new version.

1. Log into <https://marketplace.threatq.com/>.
2. Locate and download the integration file.
3. Navigate to the integrations management page on your ThreatQ instance.
4. Click on the **Add New Integration** button.
5. Upload the integration file using one of the following methods:
 - Drag and drop the file into the dialog box
 - Select **Click to Browse** to locate the integration file on your local machine

 ThreatQ will inform you if the feed already exists on the platform and will require user confirmation before proceeding. ThreatQ will also inform you if the new version of the feed contains changes to the user configuration. The new user configurations will overwrite the existing ones for the feed and will require user confirmation before proceeding.

6. If prompted, select the individual feeds to install and click **Install**. The feed will be added to the integrations page.

You will still need to [configure and then enable](#) the feed.

Configuration

ThreatQuotient does not issue API keys for third-party vendors. Contact the specific vendor to obtain API keys and other integration-related credentials.

To configure the integration:

1. Navigate to your integrations management page in ThreatQ.
2. Select the **Commercial** option from the *Category* dropdown (optional).

If you are installing the integration for the first time, it will be located under the **Disabled** tab.

3. Click on the integration entry to open its details page.
4. Enter the following parameters under the **Configuration** tab:

PARAMETER	DESCRIPTION
API Key	Your Flashpoint API Key
Excluded Domains	A comma-separated list of domains to exclude from search results.
Hide Compromised Passwords	Enable/disable the ingestion of the compromised account passwords.
Ingested Context	Select which pieces of context you want brought in with the alerts.
Ingest Account Objects	Enable/disable the creation of Compromised Account objects for the affected accounts related to the breach.

5. Review any additional settings, make any changes if needed, and click on **Save**.
6. Click on the toggle switch, located above the *Additional Information* section, to enable it.

ThreatQ Mapping

Flashpoint Compromised Accounts

The Flashpoint Compromised Accounts feed for ThreatQ enables the automatic ingestion of an organization's compromised credentials into ThreatQ.

Average Feed Run

Object counts and Feed runtime are supplied as generalities only - objects returned by a provider can differ based on credential configurations and Feed runtime may vary based on system resources and load.

METRIC	RESULT
Run Time	1 minute
Alert	1
Alert Attributes	3
Compromised Accounts	1
Compromised Account Attributes	3
