Support

This integration is designated as **ThreatQ Supported**.

Support Email: support@threatq.com

Support Web: <https://support.threatq.com>

Support Phone: 703.574.9893

Integrations/apps/add-ons designated as **ThreatQ Supported** are fully supported by ThreatQuotient's Customer Support team.

ThreatQuotient strives to ensure all ThreatQ Supported integrations will work with the current version of ThreatQuotient software at the time of initial publishing. This applies for both Hosted instance and Non-Hosted instance customers.

ThreatQuotient does not provide support or maintenance for integrations, apps, or add-ons published by any party other than ThreatQuotient, including third-party developers.

Integration Details

ThreatQuotient provides the following details for this integration:

Current Integration Version	2.1.5
Compatible with ThreatQ Versions	>= 4.50.0
Support Tier	ThreatQ Supported
ThreatQ Marketplace	https:// marketplace.threatq.com/ details/misp-connector/

Introduction

The MISP threat sharing platform is free and open source software that enables sharing of threat intelligence represented in the MISP data model format. The MISP Import integration ingests published MISP events from a user-provided, self-hosted MISP server instance via its POST `{{user_fields.domain_name}}/events/restSearch` endpoint (note: `{{user_fields.domain_name}}` must contain the protocol, like `https://`).

The integration will fetch MIPS events and return the following system objects:

- Events
- Indicators
- Attachments
- Signatures
- Adversaries
- Attack Patterns
- Course of actions
- Intrusion Sets
- Malware
- Tools
- Attack Patterns

Prerequisites

If the user intends to ingest MISP events that are related to any MITRE MISP galaxies, make sure the following feeds successfully run prior to running the MISP Import feed:

- MITRE Enterprise ATT&CK
- MITRE Mobile ATT&CK
- MITRE PRE-ATT&CK

Installation

Perform the following steps to install the integration:

The same steps can be used to upgrade the integration to a new version.

1. Log into <https://marketplace.threatq.com/>.
2. Locate and download the integration file.
3. Navigate to the integrations management page on your ThreatQ instance.
4. Click on the **Add New Integration** button.
5. Upload the integration file using one of the following methods:
 - Drag and drop the file into the dialog box
 - Select **Click to Browse** to locate the integration file on your local machine

ThreatQ will inform you if the feed already exists on the platform and will require user confirmation before proceeding. ThreatQ will also inform you if the new version of the feed contains changes to the user configuration. The new user configurations will overwrite the existing ones for the feed and will require user confirmation before proceeding.

6. If prompted, select the individual feeds to install and click **Install**. The feed will be added to the integrations page.

You will still need to [configure and then enable](#) the feed.

Configuration

ThreatQuotient does not issue API keys for third-party vendors. Contact the specific vendor to obtain API keys and other integration-related credentials.

To configure the integration:

1. Navigate to your integrations management page in ThreatQ.
2. Select the **OSINT** option from the *Category* dropdown (optional).

If you are installing the integration for the first time, it will be located under the **Disabled** tab.

3. Click on the integration entry to open its details page.
4. Enter the following parameters under the **Configuration** tab:

PARAMETER	DESCRIPTION
MISP Domain Name	The MISP server instance domain name (or IP address) preceded by the protocol it uses, such as <code>https://my-misp-server.org</code> . The provided domain name or IP address must be reachable from the ThreatQ instance.
Authorization	The MISP account API key.
Save Intrusion Sets as	The ThreatQ MITRE ATT&CK feeds can be configured to ingest Threat Actor data as Intrusion Sets or Adversaries. If the user intends to ingest MISP events that are related to any MITRE MISP galaxies, please use the same configuration as the ThreatQ MITRE ATT&CK feeds. By default, Threat Actors are ingested as Adversaries.
Query Filter Characteristics	Set which parameters that decide which events to retrieve at run-time. Options include:

PARAMETER	DESCRIPTION
	◦ Modified Events - ingest contents of any modified event since the last run. ◦ New Events - ingest events having a newer date than configured start date together with their full context.
Disable Proxies	If True, specifies that this feed should not honor any proxies setup in ThreatQuotient. The default setting is disabled.
Enable SSL Verification	If True, specifies that this feed should verify SSL connections with the provider. The default setting is enabled.

5. Review any additional settings, make any changes if needed, and click on **Save**.
6. Click on the toggle switch, located above the *Additional Information* section, to enable it.

ThreatQ Mapping

Average Feed Run

MISP server instances vary widely in their setup and the data stored within them. Due to this, average feed run results cannot be confidently provided.

Known Issues / Limitations

- MISP does not verify whether a Snort or YARA rule entered into it is valid. However, the Snort and YARA parsers used by this feed depend on the Snort or YARA rules being well-formed. Please refer to the following non-comprehensive list to aid in making sure that the Snort or YARA rules stored in your MISP server instance are valid so that they can be properly ingested by this feed.
- Snort:
 - Each rule option must be terminated with a semicolon (;).
 - Offending Snort rule: `alert tcp $HOME_NET any -> $EXTERNAL_NET [80,443,8080,7080,21,50000,995](msg:"BDS MALICIOUS Emotet Worming Traffic Likely";content:"d29ybsBzdGFydGVk";content:"POST";http_method;classtype:spreaders;sid:7;rev:1)`
 - Correction needed: `rev:1` should be `rev:1;`
 - Rule option values must be valid. For instance, options like `rev`, `sid`, and `gid` must have base 10 integers as their value.
 - Offending Snort option: `sid:#####;`
 - Correction needed: Either remove `sid` if the value is not known or replace the value with a valid ID, like `sid:7;`.
 - The value of the `snort` MISP attribute must contain at least one entire Snort rule. Multiple Snort rules can be provided in a single value if separated by newlines. The value must not contain any excess text, such as a header like `snort rule:`.
- YARA:
 - The value of the `yara` MISP attribute must contain at least one entire YARA rule. Multiple YARA rules can be provided in a single value if separated by newlines. The value must not contain any excess text, such as a header like `YARA rule:`.
 - Make sure that any text that is not valid YARA syntax is either removed or commented out.

Change Log

- **Version 2.1.5**
 - Updated the python implementation of the MISP filter to improve feed efficiency.
 - Updated the minimum ThreatQ version to 4.50.0.
- **Version 2.1.4**
 - Removed the **Use the Event Data as Query Parameter** UI configuration parameter.
 - Added new UI configuration parameter: **Query Filter Characteristics**. Time constrained data fetching for both schedule and manual runs are now user configurable via this new field.
- **Version 2.1.3**
 - Added new configuration parameter - **Use Event Date as Query Parameter**.
 - Performed updates on time constrained data fetching for both scheduled and manual runs. **Scheduled Runs** retrieve MISP events and event attributes from events that have received a modification using the start date only. **Manual Runs** can retrieve MISP events and attributes using the start date only or the start and end dates depending on configuration options. See the **Use the Event Date as Query Parameter** option in the [Configuration](#) chapter of this guide.
- **Version 2.1.2**
 - Updated the timing query parameters used for pulling data.
- **Version 2.1.1**
 - Added the ability to Normalize more Unicode quotations and hyphens
 - Add the ability to parse the YARA Rule Name ThreatQ Event Attribute from MISP Object Attributes that contain the key-value pair
object_relation: "yara-rule-name" in addition to the parsing logic added in 2.1.0, in which the YARA Rule Name ThreatQ Attribute is parsed from MISP Object Attributes that contain the key-value pair type: "yara-rule-name"
- **Version 2.1.0**
 - Normalized Unicode double quotations to ASCII double quotations in YARA and Snort signature values
 - Normalized Unicode hyphens to ASCII hyphens in YARA and Snort signature values
 - Adjusted logic used to derive a YARA rule from MISP Object Attributes. Previously, the logic depended on a MISP YARA Object having both yara and yara-rule-name attributes, in which it derived a YARA rule based on the template rule

`{{yara_rule_name}}` `{{yara}}` before passing the derived rule through the YARA parser. This was not often seen in the wild; the MISP `yara` attribute usually contains the entire YARA rule. Even the documentation for the MISP YARA Object suggests that these attributes be used in a mutually exclusive manner: use the `yara` attribute if the user has the entire YARA rule to provide to MISP; else, reference a YARA rule using the `yara-rule-name` attribute. As a result, the following changes are in this version of the CDF:

- Ingest the `yara-rule-name` MISP Object Attribute as a ThreatQ Attribute of the MISP Event object
- Ingest the `yara` MISP Object Attribute as a ThreatQ YARA Signature
- Parse MISP Suricata Objects in order to ingest its Snort Object Attributes as ThreatQ Snort Signatures.
- Although well-formed Snort rules should contain a `msg` option, which is used to derive the ThreatQ Snort Signature's Name, account for a Snort rule not containing a `msg` option by defaulting the ThreatQ Snort Signature's Name to "Snort Rule".
- **Version 2.0.0**
 - Add configuration parameter "Enable SSL Verification"
 - Change behavior of scheduled feed runs such that it only fetches data published within the last day
 - Add support for parsing MISP YARA Objects
 - Add support for parsing MISP Snort Attributes
 - Add additional key-value pairs to the MISP Galaxy Cluster Type to ThreatQ Object Type Mapping
 - Change the value of `happened_at` for ingested events by using `date` instead of `timestamp`
- **Version 1.0.4**
 - Ingest MISP Attachment Attributes as ThreatQ Attachments
- **Version 1.0.3**
 - Add configuration parameter "Disable Proxies"
- **Version 1.0.0**
 - Initial release
