# Support

This integration is designated as **ThreatQ Supported**.

**Support Email:** [support@threatq.com](mailto:support@threatq.com)

**Support Web:** <https://support.threatq.com>

**Support Phone:** 703.574.9893

Integrations/apps/add-ons designated as **ThreatQ Supported** are fully supported by ThreatQuotient's Customer Support team.

ThreatQuotient strives to ensure all ThreatQ Supported integrations will work with the current version of ThreatQuotient software at the time of initial publishing. This applies for both Hosted instance and Non-Hosted instance customers.

ThreatQuotient does not provide support or maintenance for integrations, apps, or add-ons published by any party other than ThreatQuotient, including third-party developers.

---

# Integration Details

ThreatQuotient provides the following details for this integration:

**Current Integration Version**      2.4.0

**Compatible with ThreatQ  
Versions**       $\geq 5.20.0$

**Support Tier**      ThreatQ Supported

# Introduction

The MISP threat sharing platform is free and open source software that enables sharing of threat intelligence represented in the MISP data model format. The MISP Import integration ingests published MISP events from a user-provided, self-hosted MISP server instance via its `POST {{user_fields.domain_name}}/events/restSearch` endpoint (note: `{{user_fields.domain_name}}` must contain the protocol, like `https://`).

The integration will fetch MISP events and return the following system objects:

- Events
- Indicators
- Attachments
- Signatures
- Adversaries
- Attack Patterns
- Course of actions
- Malware
- Tools

# Prerequisites

If the user intends to ingest MISP events that are related to any MITRE MISP galaxies, make sure the following feeds successfully run prior to running the MISP Import feed:

- MITRE Enterprise ATT&CK
- MITRE Mobile ATT&CK
- MITRE PRE-ATT&CK

# Installation

Perform the following steps to install the integration:

The same steps can be used to upgrade the integration to a new version.

1. Log into <https://marketplace.threatq.com/>.
2. Locate and download the integration file.
3. Navigate to the integrations management page on your ThreatQ instance.
4. Click on the **Add New Integration** button.
5. Upload the integration file using one of the following methods:
  - Drag and drop the file into the dialog box
  - Select **Click to Browse** to locate the integration file on your local machine

ThreatQ will inform you if the feed already exists on the platform and will require user confirmation before proceeding. ThreatQ will also inform you if the new version of the feed contains changes to the user configuration. The new user configurations will overwrite the existing ones for the feed and will require user confirmation before proceeding.

You will still need to [configure and then enable](#) the feed.

# Configuration

ThreatQuotient does not issue API keys for third-party vendors. Contact the specific vendor to obtain API keys and other integration-related credentials.

To configure the integration:

1. Navigate to your integrations management page in ThreatQ.
2. Select the **OSINT** option from the *Category* dropdown (optional).

If you are installing the integration for the first time, it will be located under the **Disabled** tab.

3. Click on the integration entry to open its details page.
4. Enter the following parameters under the **Configuration** tab:

| PARAMETER                      | DESCRIPTION                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>MISP Domain Name</b>        | The MISP server instance domain name (or IP address) preceded by the protocol it uses, such as <code>https://my-misp-server.org</code> . The provided domain name or IP address must be reachable from the ThreatQ instance.                                                                                                                             |
| <b>Disable Proxies</b>         | <p>If enabled, specifies that this feed should not honor any proxies setup in ThreatQuotient.</p> <p>The default setting is <b>disabled</b>.</p>                                                                                                                                                                                                         |
| <b>Enable SSL Verification</b> | <p>If enabled, specifies that this feed should verify SSL connections with the provider.</p> <p>The default setting is <b>enabled</b>.</p>                                                                                                                                                                                                               |
| <b>Rate Limit Delay</b>        | <p>The number of seconds to wait between API requests. This is useful if you are hitting rate limits on the MISP API. Rate limits are configurable on the MISP server, and can vary.</p> <div>  <p>Increase this value if you are running into 429 errors.</p> </div> |
| <b>API Key</b>                 | The MISP account API key.                                                                                                                                                                                                                                                                                                                                |

| PARAMETER                    | DESCRIPTION                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MISP Client Certificate      | Enter your MISP Client Certificate if the MISP server requires certificate-based authentication. Otherwise, leave this field blank.                                                                                                                                                                                                                          |
| MISP Client Private Key      | Enter your MISP Client Private Key if the MISP server requires certificate-based authentication. Otherwise, leave this field blank.                                                                                                                                                                                                                          |
| Query Filter Characteristics | Set which parameters that decide which events to retrieve at run-time. Options include: <ul style="list-style-type: none"> <li>◦ <b>Modified Events</b> - ingest contents of any modified event since the last run.</li> <li>◦ <b>New Events</b> - ingest events having a newer date than configured start date together with their full context.</li> </ul> |
| Threat Level Filter          | Select the Threat Levels to filter events. Option include: <ul style="list-style-type: none"> <li>◦ High (default)</li> <li>◦ Medium (default)</li> <li>◦ Low (default)</li> <li>◦ undefined (default)</li> </ul>                                                                                                                                            |
| Organization Filter          | Optional - enter a line-separated list of organization names to filter events by. If left blank, all events will be imported. If populated, only events from the specified organizations will be imported. If both Organization and Community filters are populated, events that match <b>either</b> filter will be imported.                                |
| Community Filter             | Optional - enter a line-separated list of community names to filter events by. If left blank, all events will be imported. If populated, only events from the specified communities will be imported. If both Organization and Community filters are populated, events that match <b>either</b> filter will be imported.                                     |
| Only Import Published Events | Enable this option to only import events that are marked as published in MISP.                                                                                                                                                                                                                                                                               |
| Inherited Context            | Select the pieces of context to inherit from the event to the related IOCs. Options include: <ul style="list-style-type: none"> <li>◦ Related Malware</li> </ul>                                                                                                                                                                                             |

| PARAMETER    | DESCRIPTION                                                                                                                                                                                                          |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Additional Information

Integration Type: Feed

Version:

Configuration

Activity Log

Connection Options

MISP Base URL

https://<MISP\_SERVER>

Enter the base URL for your MISP instance. This must include the HTTP scheme and port number (if applicable). Do not include any URL path components. If you are connecting over port 443, you do not need to include the port number. If you are connecting to a MISP server with a self-signed certificate, please disable the SSL verification option.

☐ Disable Proxies
 

Enable this option to bypass any platform-configured proxies for this feed.

☒ Enable SSL Verification
 

Enable this option to verify the SSL certificate of the MISP server. Disable this option if you are connecting to a MISP server with a self-signed certificate.

Rate Limit Delay (Seconds)

0

The number of seconds to wait between API requests. This is useful if you are hitting rate limits on the MISP API. Rate limits are configurable on the MISP server, and can vary. If you are running into 429 errors, increase this value.

Authentication Options

You can authenticate with MISP using some different methods. If you are unsure which method to use, you likely only need to provide the API Key. Some MISP servers may require certificate-based authentication, in addition to the API Key. If that's the case, you will need to provide the client certificate and private key. If you are unsure, please contact your MISP administrator.

API Key

MISP Client Certificate

Populate this field only if the MISP server requires certificate-based authentication

MISP Client Private Key

Populate this field only if the MISP server requires certificate-based authentication

5. Review any additional settings, make any changes if needed, and click on **Save**.
6. Click on the toggle switch, located above the *Additional Information* section, to enable it.

Event.Galaxy[] . GalaxyCluster[] . type to a ThreatQ Object Type based on the MISP Galaxy Cluster Type to ThreatQ Object Type Mapping below. |

| FEED DATA<br>PATH | THREATQ ENTITY        | THREATQ OBJECT TYPE<br>OR ATTRIBUTE KEY | PUBLISHED<br>DATE | EXAMPLES | NOTES |
|-------------------|-----------------------|-----------------------------------------|-------------------|----------|-------|
|                   | Related<br>Tool.Value |                                         |                   |          |       |

## Threat Level Mapping

| MISP THREAT LEVEL ID | THREATQ ATTRIBUTE VALUE |
|----------------------|-------------------------|
| 1                    | High                    |
| 2                    | Medium                  |
| 3                    | Low                     |
| 4                    | Undefined               |

## Distribution Mapping

| MISP DISTRIBUTION ID | THREATQ ATTRIBUTE VALUE |
|----------------------|-------------------------|
| 0                    | Your organization only  |
| 1                    | This community only     |
| 2                    | Connected communities   |
| 3                    | All communities         |
| 4                    | Sharing Group           |

## Attribute Distribution Mapping

| MISP ATTRIBUTE DISTRIBUTION ID | THREATQ ATTRIBUTE VALUE |
|--------------------------------|-------------------------|
| 0                              | Your organization only  |
| 1                              | This community only     |
| 2                              | Connected communities   |
| 3                              | All communities         |
| 4                              | Sharing Group           |
| 5                              | Inherit event           |

## Analysis Mapping

| MISP ANALYSIS ID | THREATQ ATTRIBUTE VALUE |
|------------------|-------------------------|
| 0                | Initial                 |
| 1                | Ongoing                 |
| 2                | Completed               |

## MISP Attribute Type to ThreatQ Indicator Type Mapping

| MISP ATTRIBUTE TYPE | THREATQ INDICATOR TYPE |
|---------------------|------------------------|
| md5                 | MD5                    |
| sha1                | SHA-1                  |
| sha256              | SHA-256                |
| sha384              | SHA-384                |
| sha512              | SHA-512                |
| filename            | Filename               |
| ip                  | IP Address             |
| ip-src              | IP Address             |
| ip-dst              | IP Address             |
| hostname            | FQDN                   |
| domain              | FQDN                   |
| email-subject       | Email Subject          |
| email-attachment    | Email Attachment       |
| email-src           | Email Address          |
| email-x-mailer      | X-Mailer               |

---

| MISP ATTRIBUTE TYPE | THREATQ INDICATOR TYPE |
|---------------------|------------------------|
| ssdeep              | Fuzzy Hash             |

# Average Feed Run

MISP server instances vary widely in their setup and the data stored within them. Due to this, average feed run results cannot be confidently provided.

# Known Issues / Limitations

- Authentication - users should not mix authentication methods when configuring the integration. The MISP Client Certificate and MISP Client Private Key configuration fields should only be used if required by the MISP server.
- MISP does not verify whether a Snort or YARA rule entered into it is valid. However, the Snort and YARA parsers used by this feed depend on the Snort or YARA rules being well-formed. Please refer to the following non-comprehensive list to aid in making sure that the Snort or YARA rules stored in your MISP server instance are valid so that they can be properly ingested by this feed.
- Snort:
  - Each rule option must be terminated with a semicolon (;).
  - Offending Snort rule: `alert tcp $HOME_NET any -> $EXTERNAL_NET [80,443,8080,7080,21,50000,995] (msg:"BDS MALICIOUS Emotet Worming Traffic Likely";content:"d29ybSBzdGFydGVk";content:"POST";http_method;classtype:spreader;sid:7;rev:1)`
    - Correction needed: `rev:1` should be `rev:1;`
  - Rule option values must be valid. For instance, options like `rev`, `sid`, and `gid` must have base 10 integers as their value.
  - Offending Snort option: `sid:#####;`
    - Correction needed: Either remove `sid` if the value is not known or replace the value with a valid ID, like `sid:7;`.
  - The value of the `snort` MISP attribute must contain at least one entire Snort rule. Multiple Snort rules can be provided in a single value if separated by newlines. The value must not contain any excess text, such as a header like `Snort rule:`.
- YARA:
  - The value of the `yara` MISP attribute must contain at least one entire YARA rule. Multiple YARA rules can be provided in a single value if separated by newlines. The value must not contain any excess text, such as a header like `YARA rule:`.
  - Make sure that any text that is not valid YARA syntax is either removed or commented out.

# Change Log

- **Version 2.4.0**
  - Added new configuration parameters:
    - **Organization Filter** - filter out events based on the organization that published it.
    - **Community Filter** - filter out events based on the community that published it.
    - **Only Import Published Events** - filter out events based on whether or not they are published.
    - **Threat Level Filter** - filter out events based on their threat level.
  - Reorganized user field interface order to improve consistency.
- **Version 2.3.2**
  - Added the ability to select how Tags are ingested via a new configuration parameter: **Save Tags As**.
  - Added two new certificate configuration parameters:
    - **MISP Client Certificate**
    - **MISP Client Private Key**
  - Added events pagination improvements.
  - Added new **Known Issue / Limitation** entry in the user guide regarding authentication - users should only use the MISP Client Certificate and Private Key fields if required by the MISP server.
- **Version 2.3.1**
  - Resolved an issue where uploading attachments with empty attributes would cause an error.
  - Updated minimum ThreatQ version to 5.20.0
- **Version 2.3.0**
  - Added the ability to inherit meaningful event attributes and related indicators. See the **Inherited Context** parameter in the [Configuration](#) chapter for more details.
  - Fixed parsing of YARA and Snort rules that contain unicode special space separators.
  - Removed inter-relation of domains from the **domain-ip** object types.
  - Removed the **Save Intrusion Sets As** parameter.
  - Updated **MISP Galaxy Cluster Type to ThreatQ Object Type Mapping** table.
  - Updated minimum ThreatQ version to 5.19.0
- **Version 2.2.0**
  - Added new configuration option, **Inherited Context**, to inherit context from top-level events to related IOCs.
  - Added new configuration option, **Rate Limit Delay**, to set a delay to prevent rate limiting (429 errors).
- **Version 2.1.5**
  - Updated the python implementation of the MISP filter to improve feed efficiency.
  - Updated the minimum ThreatQ version to 4.50.0.
- **Version 2.1.4**
  - Removed the **Use the Event Data as Query Parameter** UI configuration parameter.

- Added new UI configuration parameter: **Query Filter Characteristics**. Time constrained data fetching for both schedule and manual runs are now user configurable via this new field.
- **Version 2.1.3**
  - Added new configuration parameter - **Use Event Date as Query Parameter**.
  - Performed updates on time constrained data fetching for both scheduled and manual runs. **Scheduled Runs** retrieve MISP events and event attributes from events that have received a modification using the start date only. **Manual Runs** can retrieve MISP events and attributes using the start date only or the start and end dates depending on configuration options. See the **Use the Event Date as Query Parameter** option in the [Configuration](#) chapter of this guide.
- **Version 2.1.2**
  - Updated the timing query parameters used for pulling data.
- **Version 2.1.1**
  - Added the ability to Normalize more Unicode quotations and hyphens
  - Add the ability to parse the YARA Rule Name ThreatQ Event Attribute from MISP Object Attributes that contain the key-value pair `object_relation: "yara-rule-name"` in addition to the parsing logic added in 2.1.0, in which the YARA Rule Name ThreatQ Attribute is parsed from MISP Object Attributes that contain the key-value pair `type: "yara-rule-name"`
- **Version 2.1.0**
  - Normalized Unicode double quotations to ASCII double quotations in YARA and Snort signature values
  - Normalized Unicode hyphens to ASCII hyphens in YARA and Snort signature values
  - Adjusted logic used to derive a YARA rule from MISP Object Attributes. Previously, the logic depended on a MISP YARA Object having both `yara` and `yara-rule-name` attributes, in which it derived a YARA rule based on the template rule `{{yara_rule_name}} {{yara}}` before passing the derived rule through the YARA parser. This was not often seen in the wild; the MISP `yara` attribute usually contains the entire YARA rule. Even the documentation for the MISP YARA Object suggests that these attributes be used in a mutually exclusive manner: use the `yara` attribute if the user has the entire YARA rule to provide to MISP; else, reference a YARA rule using the `yara-rule-name` attribute. As a result, the following changes are in this version of the CDF:
    - Ingest the `yara-rule-name` MISP Object Attribute as a ThreatQ Attribute of the MISP Event object
    - Ingest the `yara` MISP Object Attribute as a ThreatQ YARA Signature
  - Parse MISP Suricata Objects in order to ingest its Snort Object Attributes as ThreatQ Snort Signatures.
  - Although well-formed Snort rules should contain a `msg` option, which is used to derive the ThreatQ Snort Signature's Name, account for a Snort rule not containing a `msg` option by defaulting the ThreatQ Snort Signature's Name to "Snort Rule".
- **Version 2.0.0**
  - Add configuration parameter "Enable SSL Verification"
  - Change behavior of scheduled feed runs such that it only fetches data published within the last day
  - Add support for parsing MISP YARA Objects

- 
- Add support for parsing MISP Snort Attributes
  - Add additional key-value pairs to the MISP Galaxy Cluster Type to ThreatQ Object Type Mapping
  - Change the value of `happened_at` for ingested events by using `date` instead of `timestamp`
  - **Version 1.0.4**
    - Ingest MISP Attachment Attributes as ThreatQ Attachments
  - **Version 1.0.3**
    - Add configuration parameter "Disable Proxies"
  - **Version 1.0.0**
    - Initial release
